FT-757GX

This manual is intended to serve as a technical supplement to the FT-757GX Operating Manual. Detailed information regarding functions, installation, interconnections, and operation has been provided in the Operating Manual, and is not reprinted herein. Therefore, this Technical Supplement is not intended to serve as an independent reference, but to be used in conjunction with the information provided in the Operating Manual.

Because there are nearly four hundred and fifty semiconductor devices in the FT-757GX, circuit description information is provided in the form of numerous block diagrams and a complete Component Applications list. It is our hope that this manner of providing functional information will prove to be more convenient for the owner and technician than would a lengthy verbal description. Those readers who are not familiar with the basic types of analog and digital circuits that serve as the building blocks of the FT-757GX are encouraged to study instructional material, such as that contained in handbooks on amateur radio and digital circuit design, before attempting to understand the design of the FT-757GX. Each block in the block diagrams represents one such basic circuit, while the Component Applications list provides additional details for each semiconductor. Specific circuit details are provided in the schematic diagrams.

The few modifications that have been developed for the FT-757GX since the start of production are all included in this Manual. All of these modifications have been incorporated from Production Lot 5 onwards, while some have been incorporated in some Lot 4 sets.

While we believe this technical information is correct and factual, Yaesu assumes no liability for damage that may result from typographical or other errors that may be present. Your cooperation in pointing out any inconsistencies in the technical information would be appreciated.

Yaesu Musen reserves the right to make changes in the circuitry of this transceiver, in the interest of technological improvement, without notification of the owner.

ERRATA FOR THE FT-757GX OPERATING MANUAL

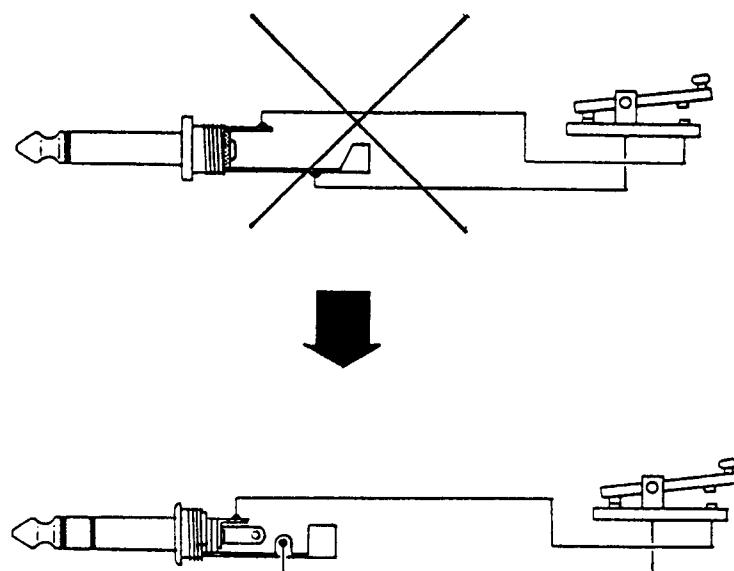

The following corrections apply to the first and second printings of the Operating Manual, with the code numbers E3890183 and E3890183A, respectively, on the back of the rear cover.

First Printing Only: KEY plug requirements

The KEY jack on the rear panel of the FT-757GX will only accept a 3-conductor phone plug for connection of a CW key, keying paddles or an

external keyer. If a 2-conductor plug is used, the outer (ground) contact will be shorted to the sleeve ring (dot) contact, and proper CW transmission will not be possible.

The information stating otherwise on pages 13 (KEYER switch description), 20 (MANUAL KEY Plug drawing), and 28 (middle of second paragraph under CW Transmission instructions) is in error and should be corrected accordingly.

First and Second Printings: QSK Linear Amplifier Connections

The two lower interconnection diagrams on page 19 do not show the connections for the changeover relay closure delay signal ("INH" in the FT-757GX), which is required in order to protect the QSK amplifier from premature excitation when the transceiver is keyed, until the changeover relay contacts in the linear are properly seated. To correct the diagrams, another connection must be shown to the rear panel of the Linear in the upper diagram, and a third conductor must be shown in the QSK Linear Amplifier Connection Cable

drawing at the lower right, one end of which connects to pin 8 of the BAND DATA plug. Later printings of the Operating Manual show screw terminal connections on the Linear, and no RCA plug on the Linear end of the cable (just free wires). The number of the (optional) cable is changed to T9101295A.

Schematic Diagram Correction: R269 on the RF UNIT

Early printings of the Schematic Diagram of the RF UNIT show the value of R269 (bottom center, near J27) as 470 ohms. This should be 150 ohms.

SOLDERING AND DESOLDERING TECHNIQUE

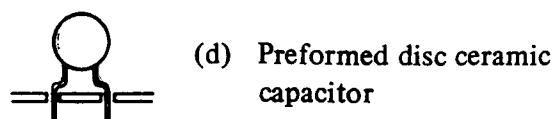

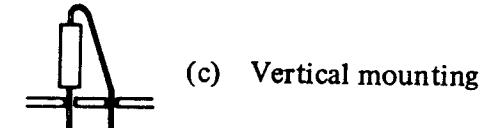

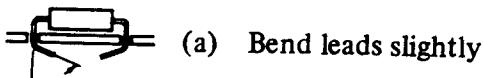

The FT-757GX circuit boards are tough, but mishandling during soldering can cause circuit traces to "lift." While this does not cause permanent damage to the board, much servicing trouble can result, because of the tendency for this lifted trace to break. A few simple precautions will keep your circuit boards in A-1 condition.

1. Use only a 12 to 30-watt chisel-tip soldering iron, with the tip grounded or isolated from AC and DC potential. Voltage at the tip can easily destroy CMOS components.
2. Use only the minimum amount of heat necessary to remove a component, or to cause the solder to "flow" when installing a new component.
3. USE ONLY 60/40 ROSIN CORE SOLDER.
4. Use solder removing braid and flux to absorb excess solder before installing a new component. A solder sucker can also be used, but most be handled with care to avoid lifting traces.
5. Do not attempt to remove DIP ICs without first cutting all of the pins on the component side of the board, unless you have the correct desoldering equipment (spring-loaded clamp and all-pin desoldering tip).

If you do lift a trace, don't worry! Read on to find out how to repair traces like a pro.

INSERTION OF PARTS ON CIRCUIT BOARDS

All of the below are acceptable ways of inserting components into circuit board mounting holes.

NOTES ON USE OF CMOS COMPONENTS:

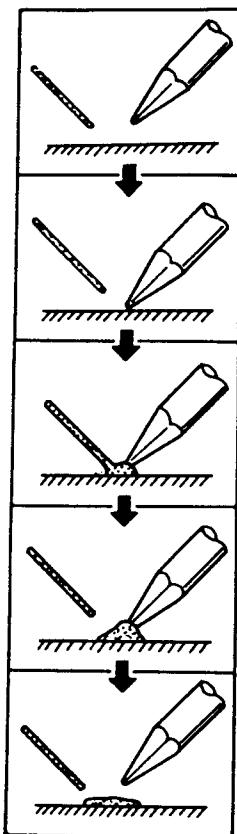

As CMOS devices are extremely sensitive to damage from static electricity, special precautions must be observed.

In storage, use only conductive sponge specially designed for CMOS components.

When installing a CMOS part in a socket, or on a circuit board, be certain that the power is off. In addition, the technician should rest his hand on the chassis as the component is inserted, so as to place his hand at the same potential as the chassis (better to discharge small amounts of static electricity through your fingers than through a \$5 IC!).

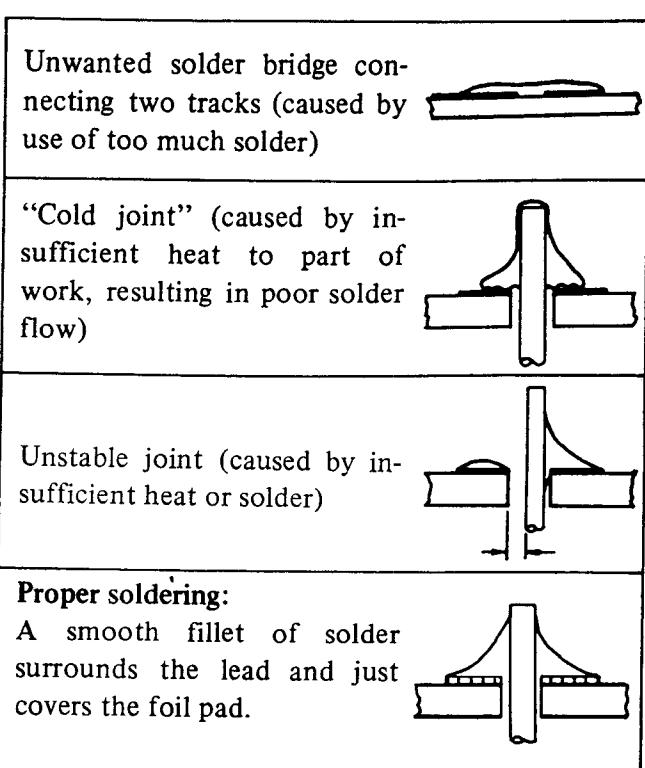

When soldering a CMOS part onto a circuit board, use a low-wattage iron, and be sure to ground the tip with a clip lead, if the tip is not grounded through a three-wire power cord.

BASIC SOLDERING PRACTICE

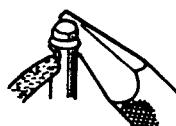

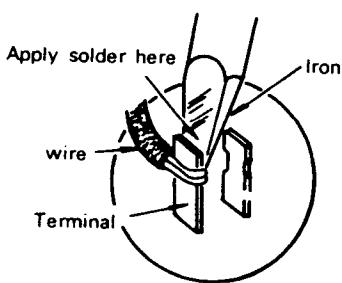

- (1) Prepare soldering iron and solder. The tip of the iron should be thoroughly tinned and wiped clean of excess solder.
- (2) Apply soldering iron to surface to be soldered. Do not press the iron into the surface.
- (3) Apply solder to junction of iron and heated surface.
- (4) When enough solder is applied, remove solder. Continue to apply heat just until solder flows cleanly.
- (5) Remove iron from work. Do not apply more heat than necessary for good solder flow.

EXAMPLES OF POOR SOLDERING PRACTICE

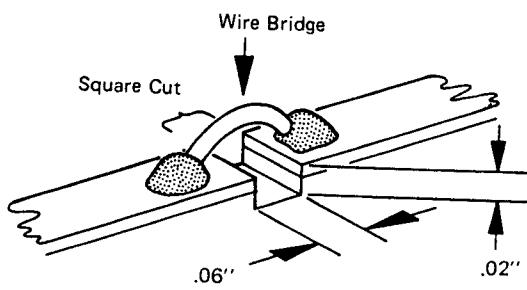

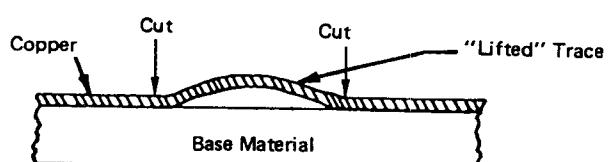

Soldering to terminal posts:

(Be certain to apply heat to both post and wire.)

If you have previously lifted a trace, make an etch cut on each side of the lifted trace as shown in the drawing, and install a wire bridge.

Coat Cut Area With Eastman 910
After Soldering Wire Bridge

TYPICAL PART FAILURES, CAUSES AND SYMPTOMS

PARTS	CAUSE OF TROUBLE	SYMPTOMS
Semiconductors (IC, FET, TR)	High supply voltage Open circuit Excessive drive High temperature	Short or open circuit Output decreases to 1/2 at 80°C Internal noise Instability
MOS FET MOS IC	Static electricity	Total failure Short or open circuit
Crystal Crystal filter	Shock High temperature Aging	No oscillation Off frequency Frequency drift Filter bandpass change
Resistor	Excessive power High temperature	Component burned Value changed Open circuit
Potentiometer	Excessive power Shock Dust or oil Wear	Component burned Open circuit Noise Unsmooth rotation
Capacitor	Excess voltage High temperature Aging	Shorted Leakage Open/decreased capacitance
Variable capacitor Trimmer capacitor	Ratings exceeded Dust between plates Shock, forced rotation	Shorted Leakage Unsmooth rotation
Coils	Ratings exceeded Misadjusted Core or bobbin broken	Open or short circuit Leakage or shorted turns Detuned
Switch	Ratings exceeded Aging Dust or oil	Poor contact Unsmooth operation Open circuit
Relay	Ratings exceeded Humidity Dust or oil on contacts	Coil open Poor or intermittent contact Noise

PERFORMANCE IMPROVEMENT MODIFICATIONS

Serial numbers are composed of a letter and a number, indicating the date of manufacture, followed by six digits. The first two digits (closest to the date code) are the Production Lot number. So, for example, serial number 0C123456 is from Production Lot 12, set number 3456. Before making any modification, make sure that it applies to the Lot number of the particular transceiver being modified.

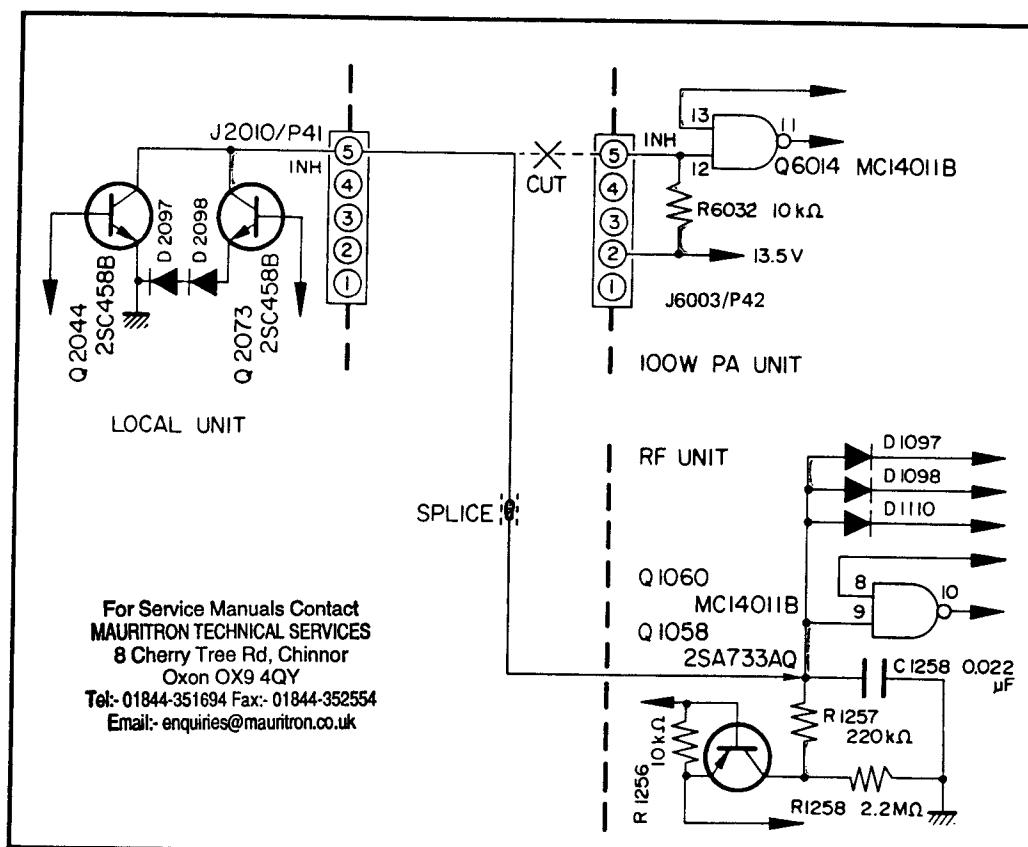

Also, before making any modification, check to see if it has already been carried out by a Yaesu agent, dealer or previous owner.

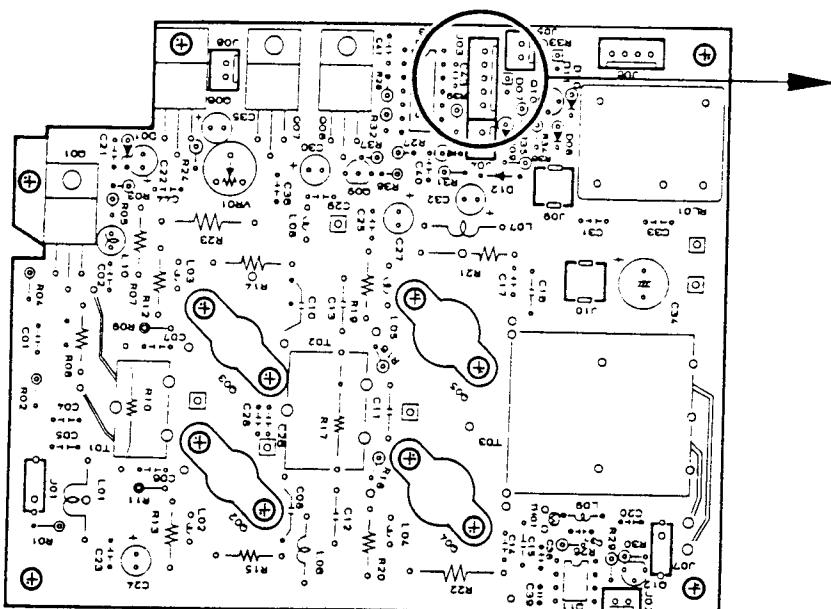

QSK Keying Stability

The following modification may be made to improve the stability of QSK operation, if it is found to be unstable. This modification has already been carried out in some Lot 4 transceivers, and in all transceivers having serial numbers above XX050000 (Lot 5).

The diagrams below and on the following pages indicate the changes to be carried out on the PA Unit and RF Unit during the following steps:

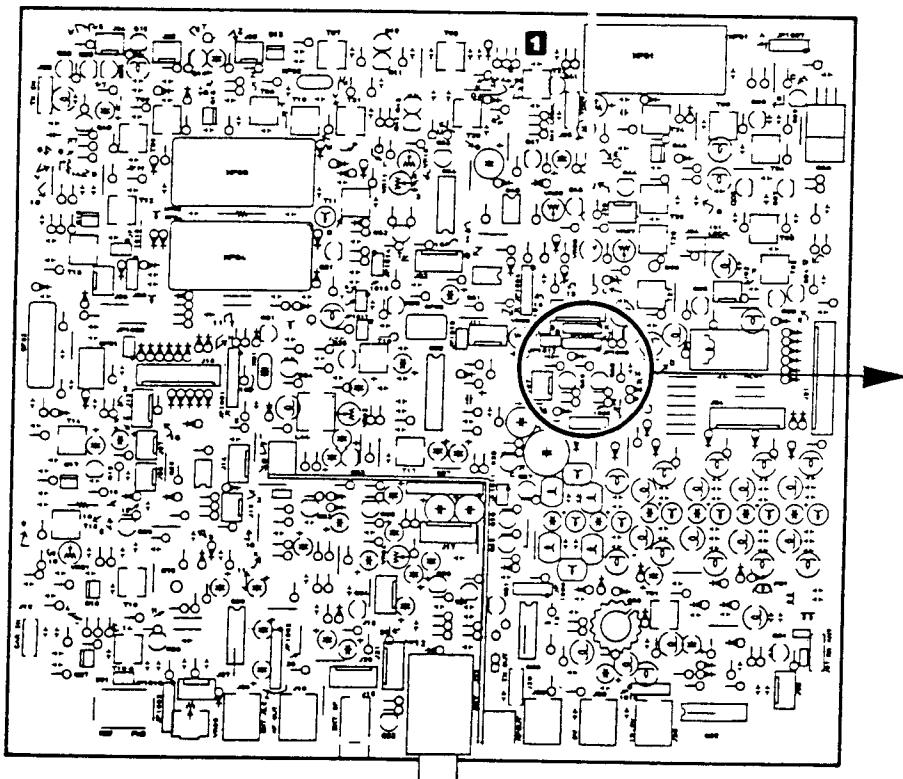

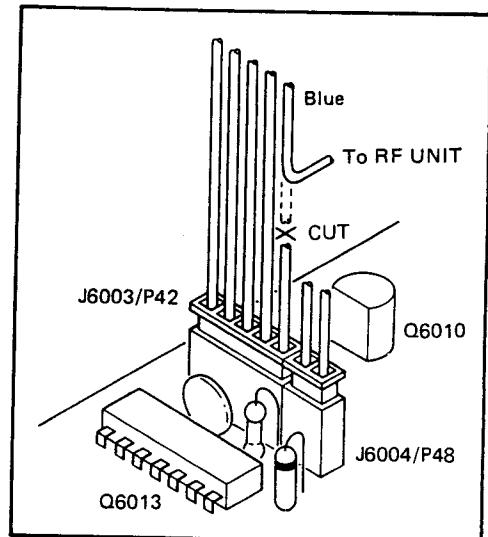

1. Referring to page 11, disconnect the transceiver from the power source and remove the covers.
2. Referring to the 100W PA Unit diagram on the following page, locate P₄₂ and cut the blue wire at pin 5 (INH signal) of this plug. Do not disturb any other connections on this Unit.
3. Now referring to the RF Unit diagram on the following page, solder a 5 cm extension wire to the end of the blue wire removed from the 100W PA Unit, and then carefully insulate the splice with vinyl tape. Solder the other end of the extension to the end of R₁₂₅₇ exposed on the component side of the RF Unit.
4. Route the blue wire carefully so that it will not be pinched when replacing the boards and covers, and then reassemble the parts removed. This completes the modification.

RF UNIT

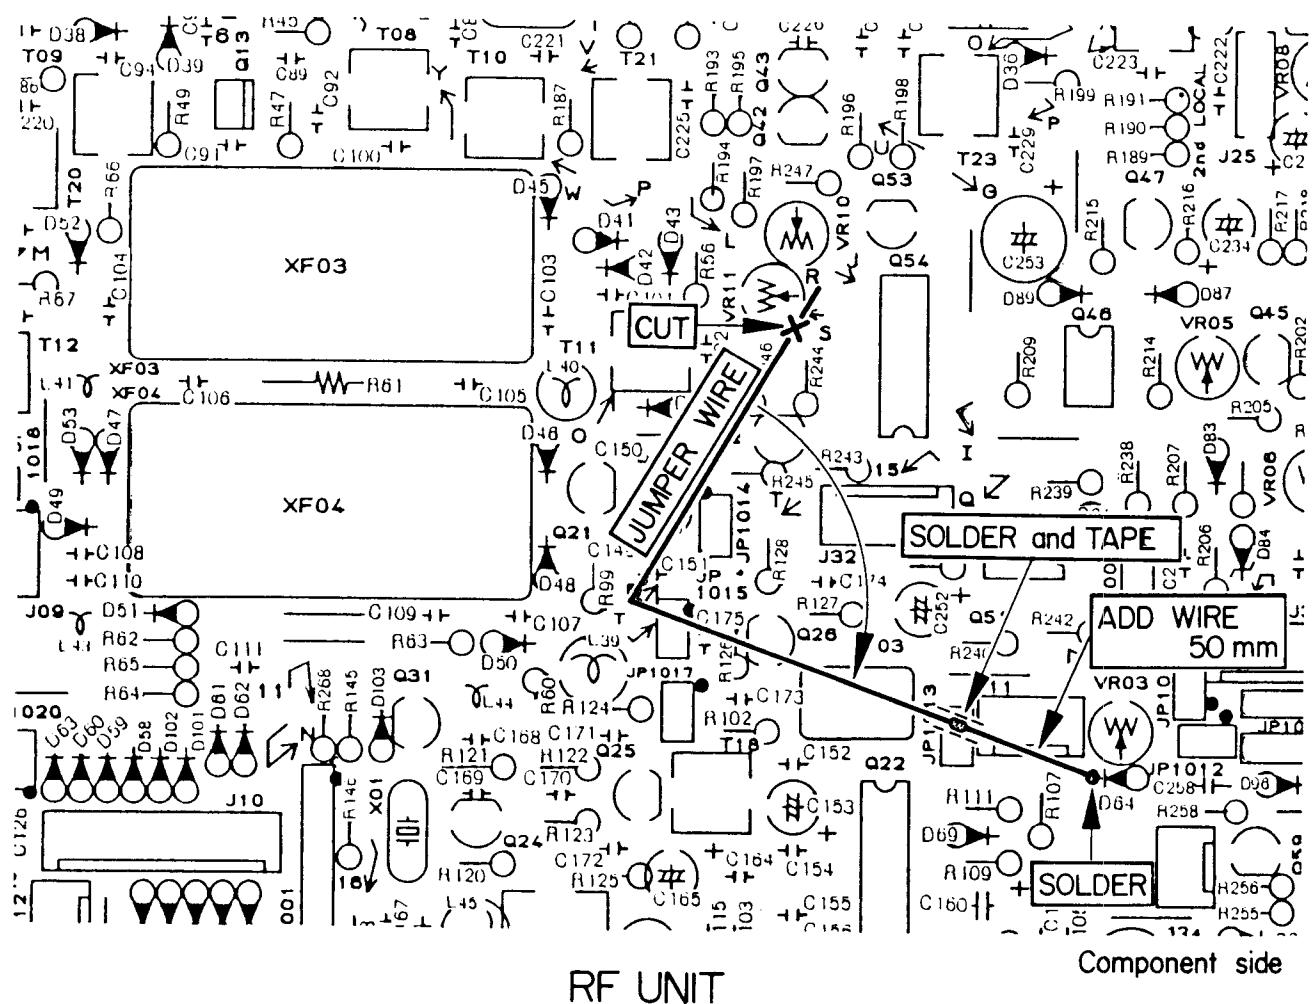

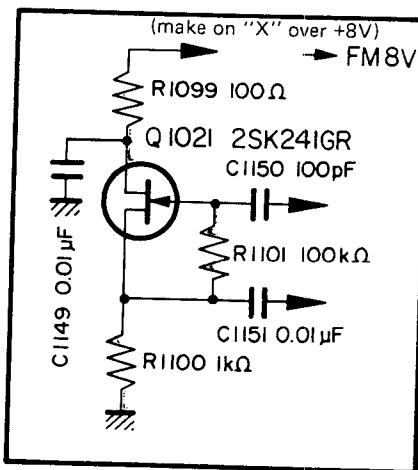

CW Filter Isolation

In some sets prior to Lot 6, IF signal leakage has been found to occur around the CW filter during CW-N reception with the FT-757GX. The cause of this problem is insufficient isolation within FM detection subsystem IC Q₁₀₂₂ (MC3359) on the RF Unit during CW operation. To remedy this problem the following modification will remove the supply voltage from FM 2nd IF signal buffer Q₁₀₂₁, except during FM operation. This modification has already been carried out in all sets from the beginning of Lot 6 onwards, as well as in some of the later sets in Lot 5.

1. Disconnect the power supply, and remove the bottom cover of the transceiver to gain access to the component side of the RF Unit.
2. Referring to the drawing below, cut jumper wire R near the end closest to VR₁₀₁₀ and VR₁₀₁₁. Splice a 3 to 5 cm length of hookup wire to the free end of the jumper, and solder and carefully tape the splice.

3. Now connect the free end of the extended jumper to the cathode of diode D₁₀₆₄ (near VR₁₀₀₃). The cathode lead of this diode is the upper (exposed) lead.
4. Replace the bottom cover and reconnect the power supply. This completes the modification.

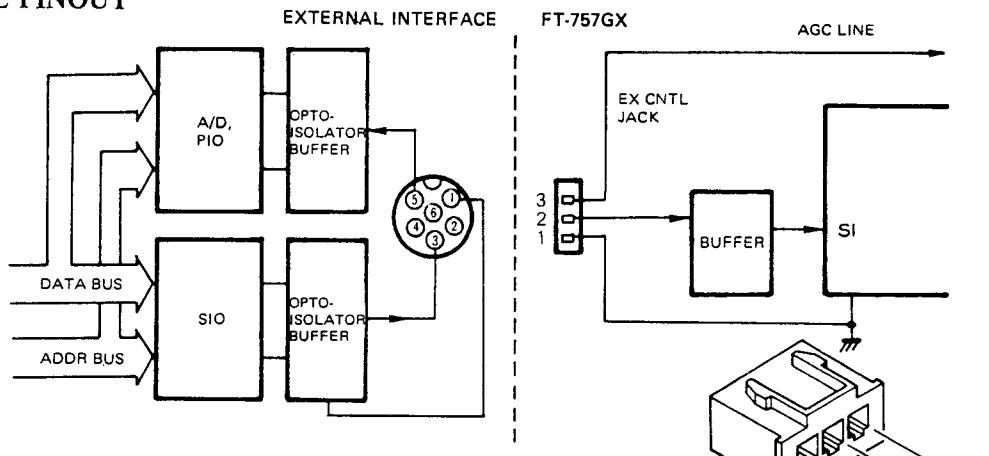

RF UNIT

CAT SYSTEM SERIAL INTERFACE DATA MANUAL

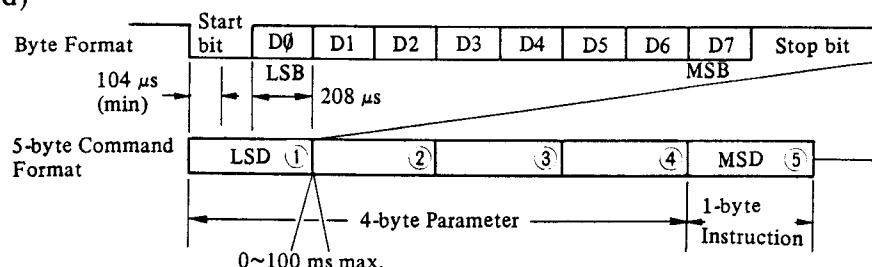

The CAT (Computer-Aided Transceiver) System in the FT-757GX allows use of an external microcomputer to control the memory and operating frequency functions of the transceiver. Control signals are passed to the transceiver on a serial data line, accessible at the EXT CNTL jack on the rear of the transceiver. Yaesu offers a number of different Interface Units for making the necessary data format conversions to connect some of the common brands of microcomputers. Software is provided with some of the Yaesu Interface Units when they are designed for use with one specific microcomputer. The EXT CNTL jack also provides access to the receiver AGC line, for application in user's programs.

EXT CNTL PINOUT

PIN	NAME	DESCRIPTION
1	GND	Common ground for signal lines and shielding. (1)
2	SI	Serial Input: accepts standard TTL-level data.
3	AGC	Automatic Gain Control: analog signal output ranging from +0.4V DC during strong signal reception, to +2.6V DC when no signal is being received.

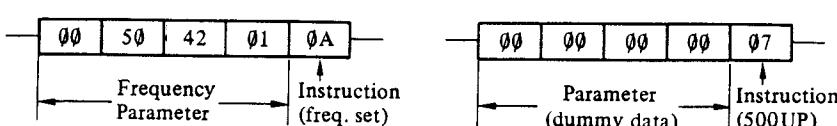

DATA TIMING FORMAT (4800 bits/second)

Shown below are examples of two basic types of commands. Each is five bytes in length.

Frequency Enter Command
(Example: to set 14.25000 MHz)

Frequency Step Command
(Example: to step up 500 kHz)

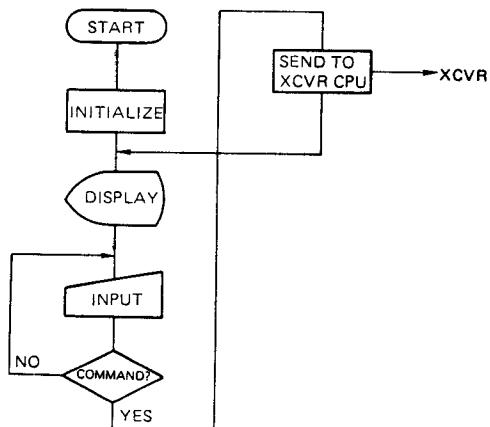

As illustrated in the Frequency Enter Command example, frequency parameter data is sent least-significant digit first. The Frequency Step Command example shows how dummy data ("00") is required in all other commands, preceding the instruction byte.

Once the 5-byte command has been sent to the transceiver, it will respond with the appropriate change indicated on the front panel display. If not, an error has occurred either in the data sent or in the interface connection, so these should

be inspected before the command is sent to the transceiver again. Note that the controls on the transceiver are not disabled when exercising external control; touching any control on the transceiver that duplicates an externally-controlled function will invalidate function indications on the computer display. The external control program may then have to be reinitialized to clear invalidated variables. To avoid problems caused by inadvertent movement of the tuning knob, the D. LOCK command can be programmed to be sent to the transceiver during external control operation.

PROGRAMMING

COMMAND BYTE CODES

No.	COMMAND	DATA					FUNCTION
		1	2	3	4	5	
1	SPLIT	X	X	X	X	01	VFO-A/VFO-B SPLIT ON and OFF.
2	MR/VFO	X	X	X	X	02	Exchange operating freq. between memory and VFO.
3	V ► M	X	X	X	X	03	Write VFO data into memory.
4	D LOCK	X	X	X	X	04	Lock tuning dial.
5	VFO A/B	X	X	X	X	05	Exchange operation between VFOs A and B.
6	M ► V	X	X	X	X	06	Write memory data into operating VFO.
7	500 UP	X	X	X	X	07	Step up 500 kHz (Band Up)
8	500 DWN	X	X	X	X	08	Step down 500 kHz (Band Down)
9	CLAR	X	X	X	X	09	Activate or deactivate clarifier.
10	Frequency set	1	2	3	4	0A	Enter new operating frequency.
11	V □ M	X	X	X	X	0B	Exchange freq. data between VFO and memory.

"X" = dummy data (value irrelevant)

① ② ③ ④ : Frequency data, LSB first.

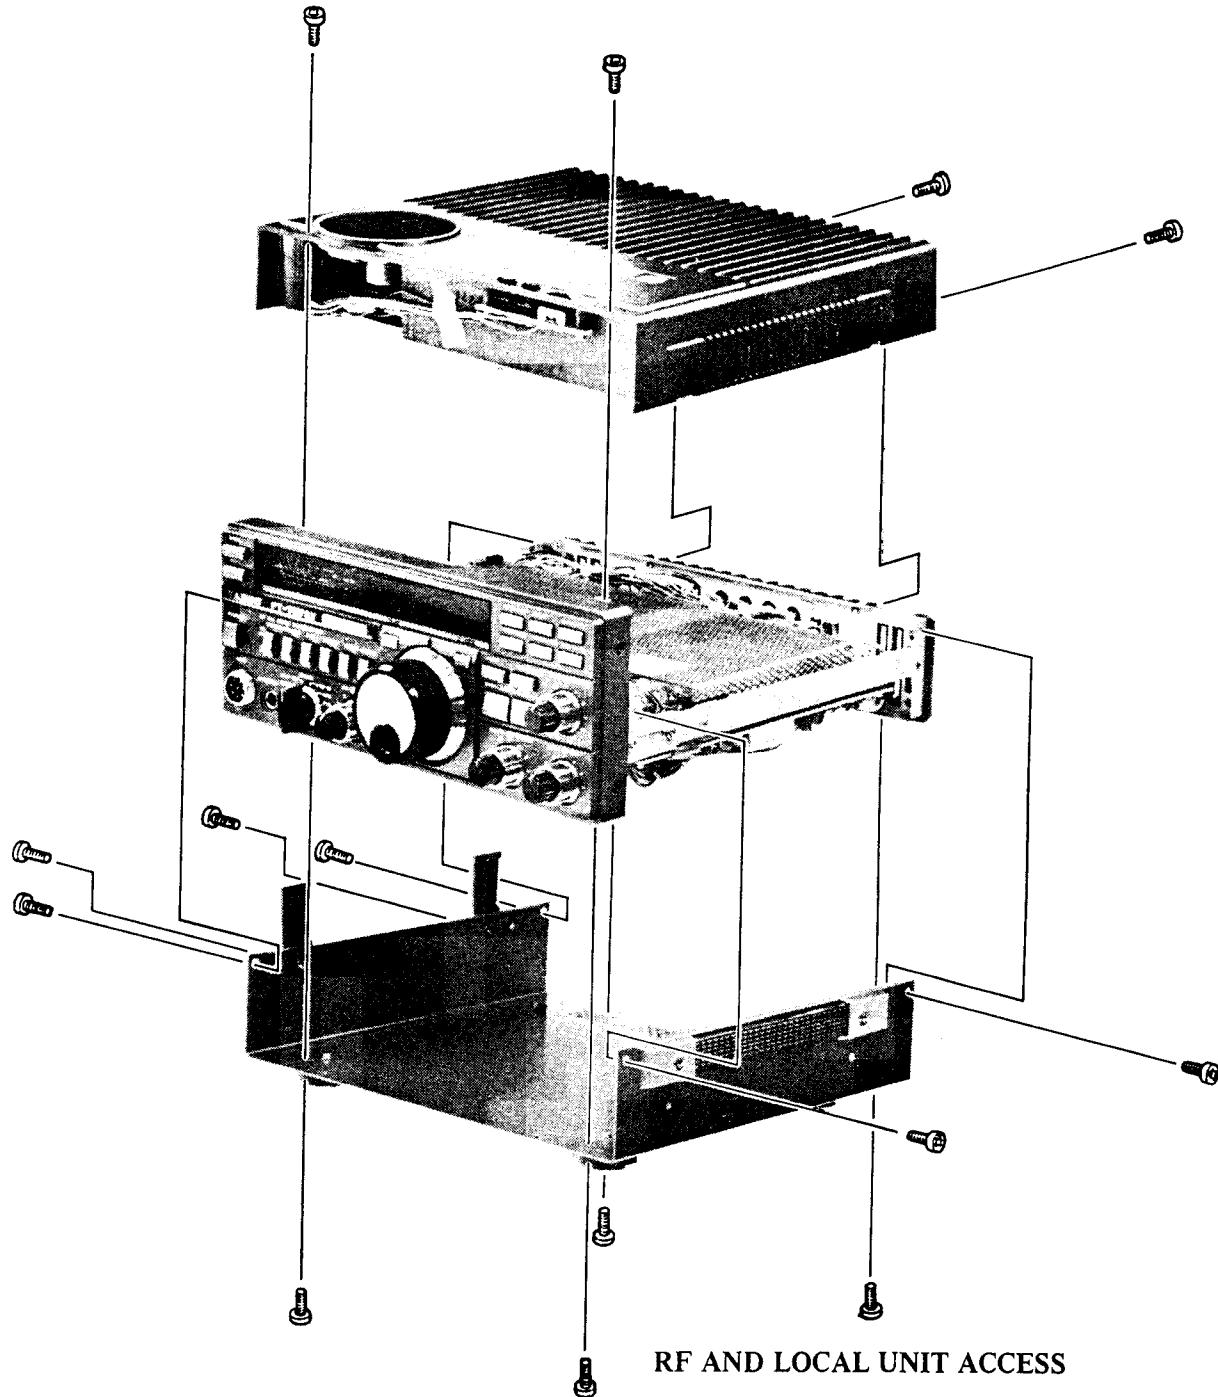

Example: 12.345.67 MHz is stored as follows.
(referring to the data locations in the Table):

- ① - 67
- ② - 45
- ③ - 23
- ④ - 01

Data output routines in the external computer may have to be in machine language, as BASIC and other high-level languages are generally too

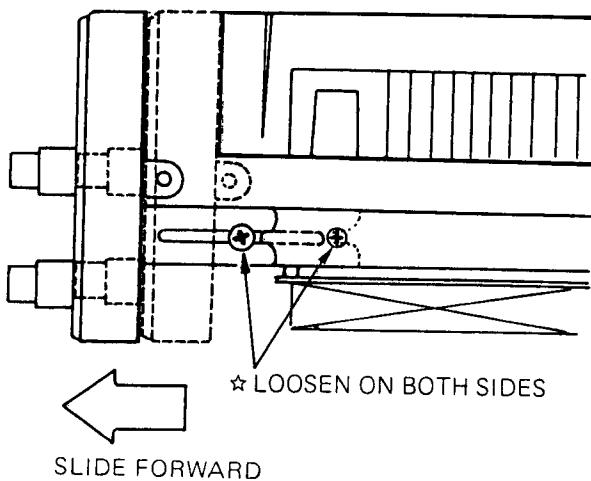

slow to handle the required routines during data transfer, unless the computer is equipped for 4800-baud output.

OUTER COVER REMOVAL

RF AND LOCAL UNIT ACCESS

For access to the solder sides of the RF and Local Units, loosen the screws (marked *) on each side and slide the front panel forward.

To remove the RF Unit, the KEY jack nut must be removed using a special wrench (see your Yaesu agent). Disconnect the following plugs from their corresponding jacks on the RF UNIT: J₂₇/P₁₄, J₂₁/P₀₈, J₂₉/P₀₅, J₀₃/P₀₃, J₀₁/P₀₁ and J₃₄/P₀₃. Remove the 5 screws in the board and the KEY jack nut. Then note the position of the FWD SET knob, and remove it (it should be replaced in the same position).

SERVICE AND ALIGNMENT

The FT-757GX is carefully designed to allow the knowledgeable operator to make all adjustments required for various station conditions, modes and operator preferences simply from the controls on the front and rear panels, without opening the case of the transceiver. These adjustments are described in the FT-757GX Operating Manual.

The following procedures cover the sometimes critical and tedious adjustments that are not normally required once the transceiver has left the factory. We recommend that these adjustments be made only by authorized Yaesu service representatives, as many are interdependent and difficult to perform correctly without prior experience with FT-757GX alignment. Without such experience and the proper test equipment, any attempt to make internal adjustments is likely to cause degraded transceiver performance, the correction of which is not covered by the warranty policy when caused by unauthorized internal adjustments.

In the unlikely event that a sudden failure occurs during normal operation, do not attempt realignment. Such failures are almost always due to the failure of a component, often in an external accessory, or a problem with the antenna system. Once the external connections have all been checked, if the transceiver is still suspect, the Yaesu representative through whom the transceiver was originally purchased should be contacted immediately for instructions regarding repair. Authorized Yaesu service technicians automatically perform complete performance checks and realignment of all circuits that may be affected once a faulty component has been replaced.

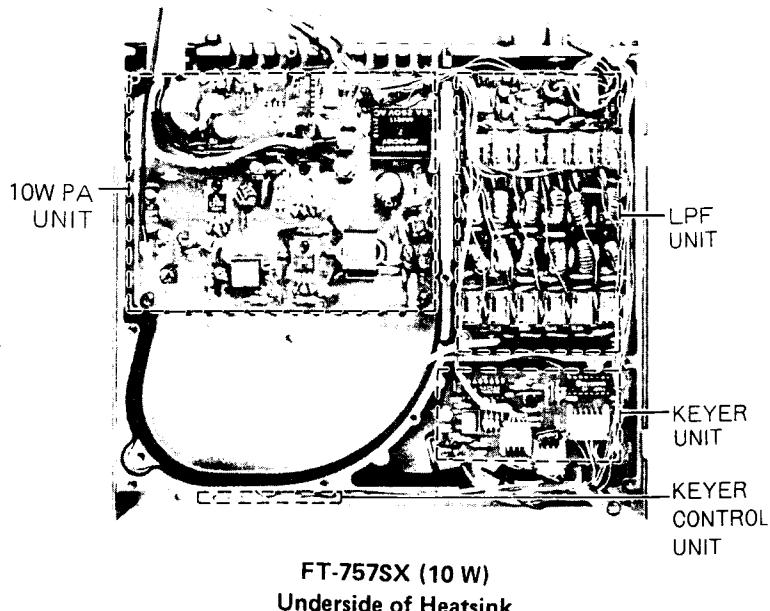

Those who do undertake any of the following alignments are cautioned to proceed only at their own risk. Yaesu must reserve the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners. Under no circumstances should any realignment be attempted unless the normal function and operation of the transceiver are clearly understood, the malfunction has been carefully analyzed and any faulty components replaced, and the need for a specific realignment determined to be absolutely necessary. Procedures not involving adjustments are termed checks, and are included for troubleshooting purposes.

The following test equipment (and thorough familiarity with its use) is required for complete alignment. While most steps do not require all of the equipment listed, the interactions of such adjustments may require that more complex adjustments be performed afterwards. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Rather, have all test equipment ready before beginning, and follow all of the steps in the order that they are given in each section.

During all of the following procedures that call for the transmitter to be activated, a 50-ohm dummy load must be connected to the antenna jack, except where specifically stated otherwise.

Also, the WIDTH/SHIFT controls must be set to the 12 o'clock position, the RF gain control must be fully clockwise, and the SQL control must be fully counterclockwise, unless stated otherwise.

After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except dummy load and wattmeter) before proceeding.

Alignment Equipment

Frequency counter with accuracy of 0.1 ppm to 100 MHz

DC voltmeter with at least 10-Megohm input impedance

RF voltmeter with at least 5% accuracy to 100 MHz, high impedance, and ranging from 10 mV to 3 Vrms

AF millivoltmeter

DC milliammeter ranging to 500 mA

X-Y oscilloscope with 60 MHz bandwidth

RF in-line wattmeter

Resistive dummy load, 50 ohms, 150W; three required for SWR Turndown alignment

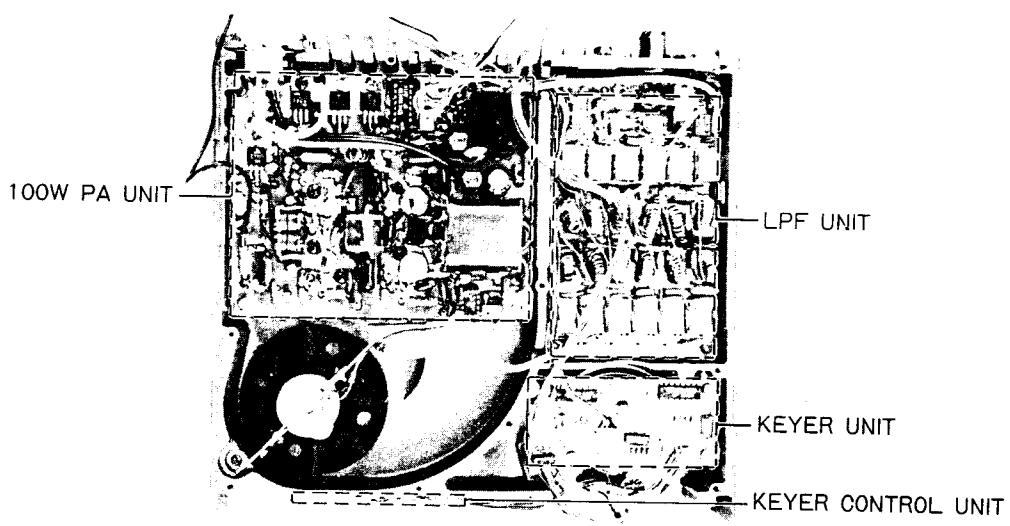

RF signal generator covering 1-30 MHz, with calibrated output levels from 5 dB μ to 100 dB μ

AF signal generator with calibrated output levels from 1 mV to 25 mV

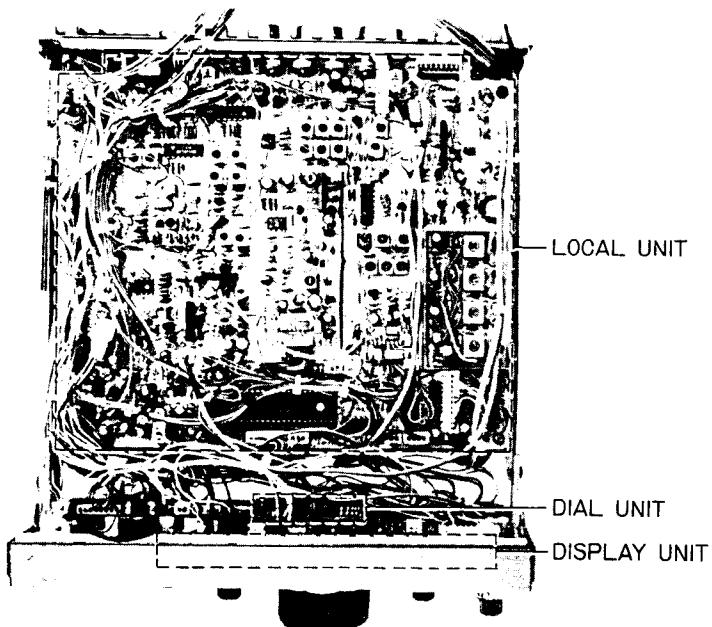

FM deviation meter/SINADer and RF sampling coupler ("T") for FM modulator alignment

Monitor scope for transmitter output display

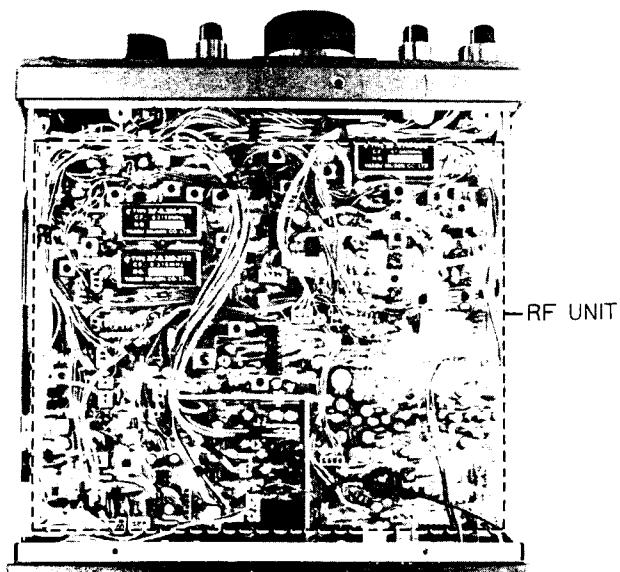

Linear detector for 1-30 MHz

FT-757GX
Underside of Heatsink

Chassis Top View

Chassis Bottom View

ALIGNMENT

LOCAL Unit

A. Third LO BPF

Remove P_{17} and connect a 50-ohm load across 3rd LO OUT jack J_{2008} , along with the RF voltmeter. Set the transceiver to a CW mode, and while receiving, adjust T_{2001} and T_{2002} for maximum deflection on the voltmeter (50 mVrms nominal).

B. SSB, AM, CW RX LO Level

Connect the RF voltmeter to pin 2 of Q_{2012} and adjust TC_{2002} so that the difference in level between CW transmit and receive is less than 5 mVrms at this point (output level approximately 100 mVrms).

C. 45 MHz Bandpass Filter

With the transceiver set to the 14 MHz band, connect the RF voltmeter to TP_{2006} and adjust T_{2009} and T_{2010} for maximum voltmeter deflection (more than 80 mVrms).

D. 60 MHz Bandpass Filter

Set the transceiver to the 21 MHz band, and with the RF voltmeter connected as in the previous step, adjust T_{2011} and T_{2012} for maximum deflection (more than 80 mVrms).

E. 45 MHz Tripler

Return the transceiver to the 14 MHz band, and connect the RF voltmeter to TP_{2002} . Adjust T_{2006} and T_{2007} for maximum deflection (more than 80 mVrms).

F. 15 MHz Reference Frequency

Connect the frequency counter to TP_{2002} and adjust TC_{2006} for 45 MHz ± 20 Hz.

G. 2nd Local Oscillator Frequency

1. Connect the frequency counter to TP_{2007} , and tune the transceiver so that the display indicates 14.000.00. Adjust VR_{2006} so that the counter shows 32.06000 MHz ± 20 Hz.
2. Retune the transceiver so that the display shows 13.999.99, and adjust VR_{2014} , if necessary, to obtain 32.05901 MHz on the counter. Now retune the transceiver to 14.000.00 and check that the difference in

the frequencies shown on the counter are within 990 Hz ± 5 Hz.

H. Carrier Point

Connect the frequency counter to J_{2008} and adjust the component indicated in the corresponding mode for the frequency shown below:

MODE	ADJUST	COUNTER FREQUENCY
LSB	TC_{2005}	8213.400 kHz (± 50 Hz)
CW	TC_{2004}	8215.900 kHz (± 10 Hz)
USB	VR_{2005}	8216.600 kHz (± 50 Hz)

I. BFO Frequency

Set the transceiver to a CW mode, and connect the frequency counter to pin 2 of Q_{2012} . Adjust TC_{2001} while receiving for 15.000700 MHz (± 10 Hz) on the counter.

J. FM/AM Carrier Frequency

1. Set the transceiver to the FM mode, and connect the frequency counter to J_{2007} . Adjust VR_{2004} while transmitting for 8.215000 MHz (± 50 Hz) on the counter.
2. Rotate the AM CAR control (VR_{2008}) fully clockwise, and set the transceiver to the AM mode. Close the PTT line and check the counter for 8.215000 MHz ± 300 Hz.

K. Carrier Level

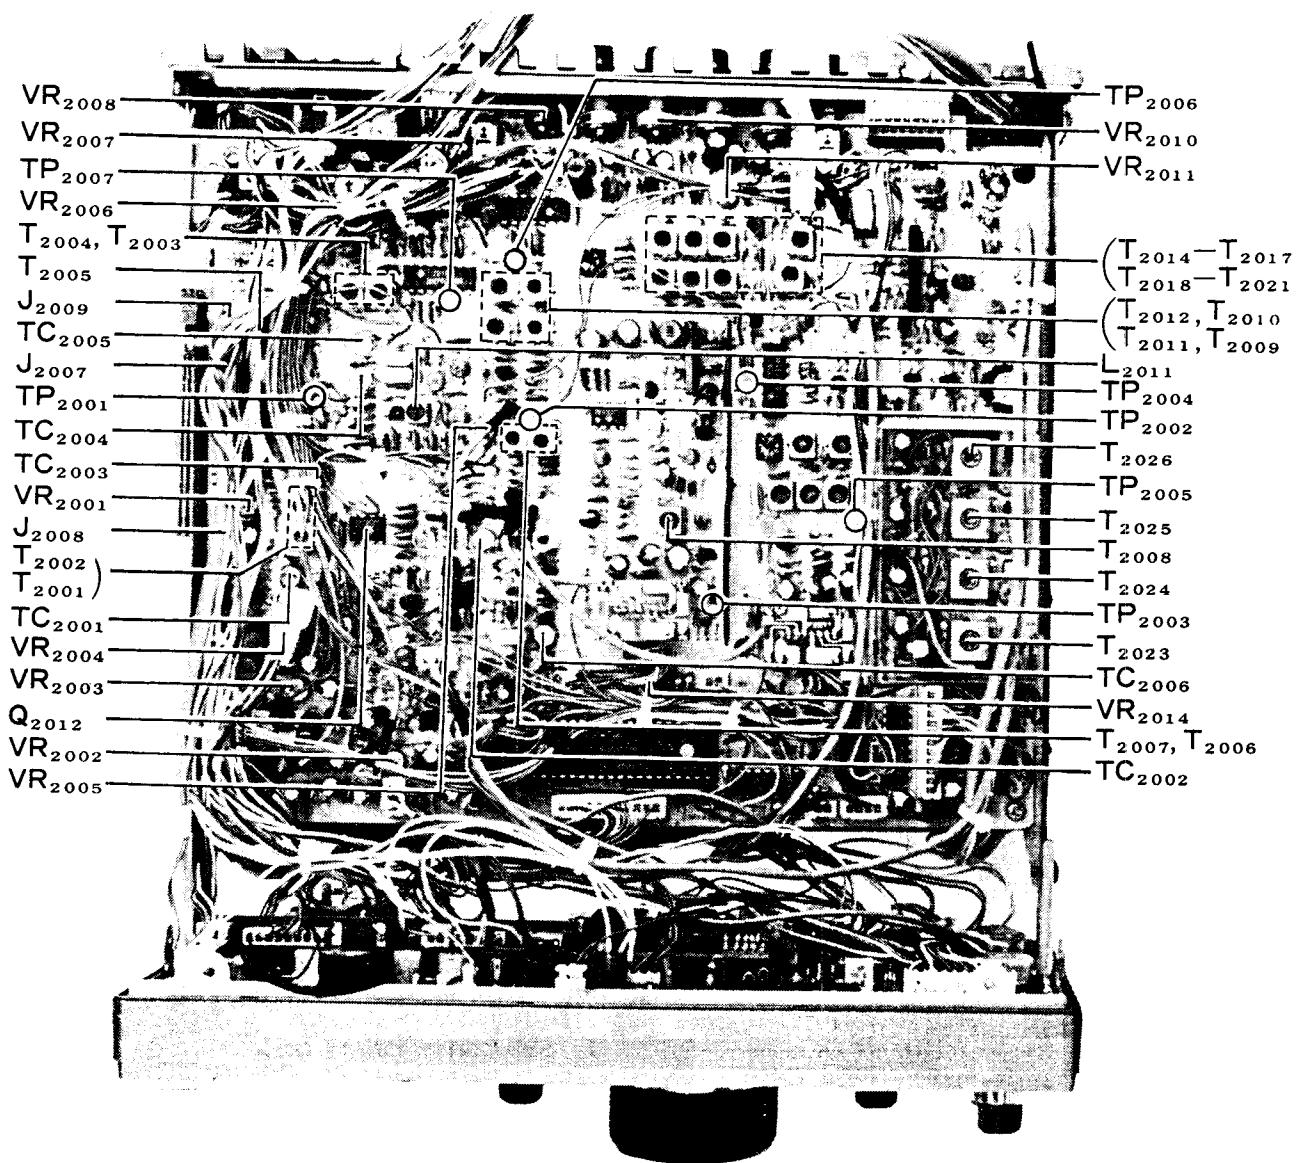

Set the transceiver to the LSB mode, and connect the RF voltmeter to TP_{2001} . Close the PTT line and adjust TC_{2003} for 90 mVrms (± 5 mV).

L. Carrier Balance

With the transceiver set to LSB, connect the RF voltmeter to J_{2007} , and adjust VR_{2001} for minimum voltage on the meter.

M. AM Carrier Level

1. With the RF voltmeter connected to J_{2007} , set the mode to CW, key the transmitter, and note the voltage indicated on the meter (approx. 200 mVrms).
2. Return to receive, switch the mode to AM, close the PTT line and adjust AM CAR control VR_{2008} for exactly half of the voltage noted in the previous step.

Chassis Top View: LOCAL Unit
Adjustment Locations

N. PLL Subloop (PLL-1) VCC

1. Connect the hi-Z DC voltmeter to TP₂₀₀₃ and tune the transceiver for 14.499.00 on the display. Adjust T₂₀₀₈ for 5.5 V on the meter.
2. Retune the transceiver for a display of 14.500.00, and check for 2 to 3 volts on the meter.

O. 41 and 56 MHz Bandpass Filters

1. Connect the RF voltmeter to TP₂₀₀₄ and tune the transceiver for 14.250.00 on the display. Adjust T₂₀₁₄ through T₂₀₁₇ for maximum deflection on the voltmeter (more than 60 mVrms).
2. Retune the transceiver to 21.250 MHz, and adjust T₂₀₁₈ through T₂₀₂₁ for maximum deflection on the voltmeter (more than 60 mVrms).

P. Main PLL (PLL-2) VCC

1. Connect the hi-Z DC voltmeter to TP₂₀₀₅ and tune the transceiver to the frequencies shown in the following chart, adjusting the corresponding transformer for 1.5 V on the meter. Then retune the transceiver to the corresponding "check" frequency, and check for 5 to 6 V on the meter.

ADJUSTMENT (for 1.5V)		CHECK (for 5-6V)
Freq. (MHz)	Transformer	Freq. (MHz)
0.500	T ₂₀₂₃	7.499
7.500	T ₂₀₂₄	14.499
14.500	T ₂₀₂₅	21.499
21.500	T ₂₀₂₆	29.999

2. Check for proper VCC control by tuning between the adjustment and check frequencies in each of the above four ranges, using the tuning knob or microphone scanning buttons, and watching the DC voltmeter for smooth voltage change. If the voltage changes unevenly, or jumps, a fault is indicated.

Q. 2nd Local Level

Connect the RF voltmeter to J₂₀₀₉. Adjust T₂₀₀₃ through T₂₀₀₅ for maximum RF voltage on the meter (at least 110 mVrms).

R. IF Shift Zero Point Set

1. Connect the frequency counter to J₂₀₀₉, and with the Shift and Width controls centered, note the counter frequency while receiving. Then key the transmitter and adjust VR₂₀₀₇, if necessary, so that the frequency shown on the counter is within 50 Hz of that shown while receiving.
2. While receiving, check the total adjustment range of the Shift control in USB, LSB and CW, which should be approximately ± 1.3 kHz as shown on the counter. If not, adjust L₂₀₁₁ (not more than 90° in either direction), and then repeat adjustments H, I and J (Carrier Point, BFO Frequency and FM/AM Carrier Frequency), and then this check again.

S. VOX Gain Preset

1. Preset VR₂₀₁₁ fully clockwise, and set the VOX GAIN control on the rear panel fully clockwise. Connect the AF signal generator to the PATCH jack, and apply a 1 kHz signal at 1 mV to check to see if the transmitter activates.
2. Now rotate the VOX GAIN control fully counterclockwise, and slowly adjust VR₂₀₁₁ counterclockwise to the point where the transceiver returns to receive, and then a little further counterclockwise from this point.

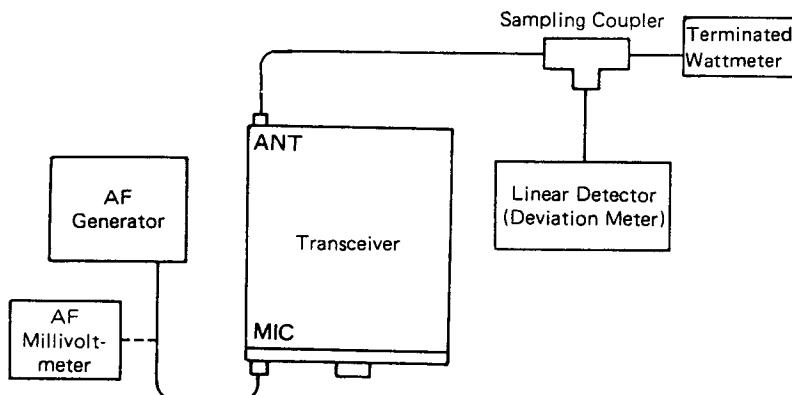

T. SSB Carrier Point Check

1. With the AF generator connected as in the previous step, set the transceiver to the 14 MHz band, USB mode. Close the PTT line and adjust the MIC gain control for 100 watts output (into the dummy load/wattmeter). For the 10-watt model FT-757SX, divide all power outputs by 10.
2. Reduce the frequency of the audio generator while watching the wattmeter, to obtain 25 watts output. Check that the audio frequency is below 350 Hz.
3. Now increase the frequency of the AF generator so that the power output rises to full power and then down to 25 watts again above 2 kHz. Check that the audio frequency is now above 2900 Hz.

4. Return to receive, switch to LSB, and repeat the above checks in this mode. If 25 watts output is not obtained outside the specified frequency in any of these checks, repeat the Carrier Point (H) and then the IF Shift Zero Point (R) procedures.

U. FM Modulation

1. With the test equipment connected as shown in the following diagram, preset VR₂₀₀₂ fully clockwise, and set the AF generator for 10 mV output at 1 kHz. Set the transceiver to FM.
2. Adjust VR₂₀₀₃ for ± 5 kHz deviation (± 100 Hz), and then reduce the AF generator output level to 1.5 mV, and adjust VR₂₀₀₂ for ± 3.5 kHz deviation (± 100 Hz).
3. Recheck deviation with 10 mV audio, and repeat the above steps until deviation is within the specified ranges for both audio levels.

RF Unit: Receiver Circuits

A. 3rd Local Buffer

Connect the RF voltmeter to the emitter of Q₁₀₂₈ and adjust T₁₀₁₉ for maximum RF voltage (0.7 to 0.9 Vrms).

B. 2nd Local Buffer

Connect the RF voltmeter to the jumper between T₁₀₀₆ and T₁₀₂₃ on the component side of the board, and adjust T₁₀₂₂ for maximum RF voltage (0.25 to 0.35 Vrms).

C. Width Oscillator (Coarse)

1. Connect the frequency counter through a 0.01 uF capacitor to pin 1 of Q₁₀₂₂. Set the WIDTH control to the 12 o'clock position, and adjust L₁₀₄₄ for 8.670 MHz ±100 Hz on the counter (coarse adjustment).
2. Connect the RF voltmeter to gate two of Q₁₀₁₆ and adjust T₁₀₁₉ for maximum RF voltage (0.5 to 0.6 Vrms).

D. RX IF Transformers

Preset VR₁₀₀₁ fully clockwise and adjust VR₁₀₁₀ to the point where the S-meter just begins to deflect. Apply a 60 dB signal at 14.000 MHz from the RF signal generator to the antenna jack, and adjust T₁₀₁₆ through T₁₀₁₀ and T₁₀₀₇ through T₁₀₀₄, in that order, for maximum S-meter deflection. Reduce the signal generator level as necessary to keep the meter below full scale.

E. Width Oscillator (Fine)

With the WIDTH and SHIFT controls both set to the 12 o'clock position, switch the mode back and forth between LSB and USB, adjusting L₁₀₄₄ for the same noise pitch.

F. IF Gain and S-Meter Sensitivity

1. Apply a 6 dB signal at 14.000 MHz from the RF signal generator to the antenna jack, and adjust VR₁₀₀₁ for an S-meter deflection of S-1.
2. Increase the RF signal level to 100 dB and adjust VR₁₀₁₁ so that the S-meter indicates just to full scale.

G. Noise Blanker

Connect the DC voltmeter to gate two of Q₁₀₁₃, and with the RF signal generator connected as above, set the RF level to 40 to 60 dB at 14.000 MHz. With the NB button depressed, adjust T₁₀₀₈ and T₁₀₀₉ for minimum DC voltage on the meter.

H. FM 3rd Local

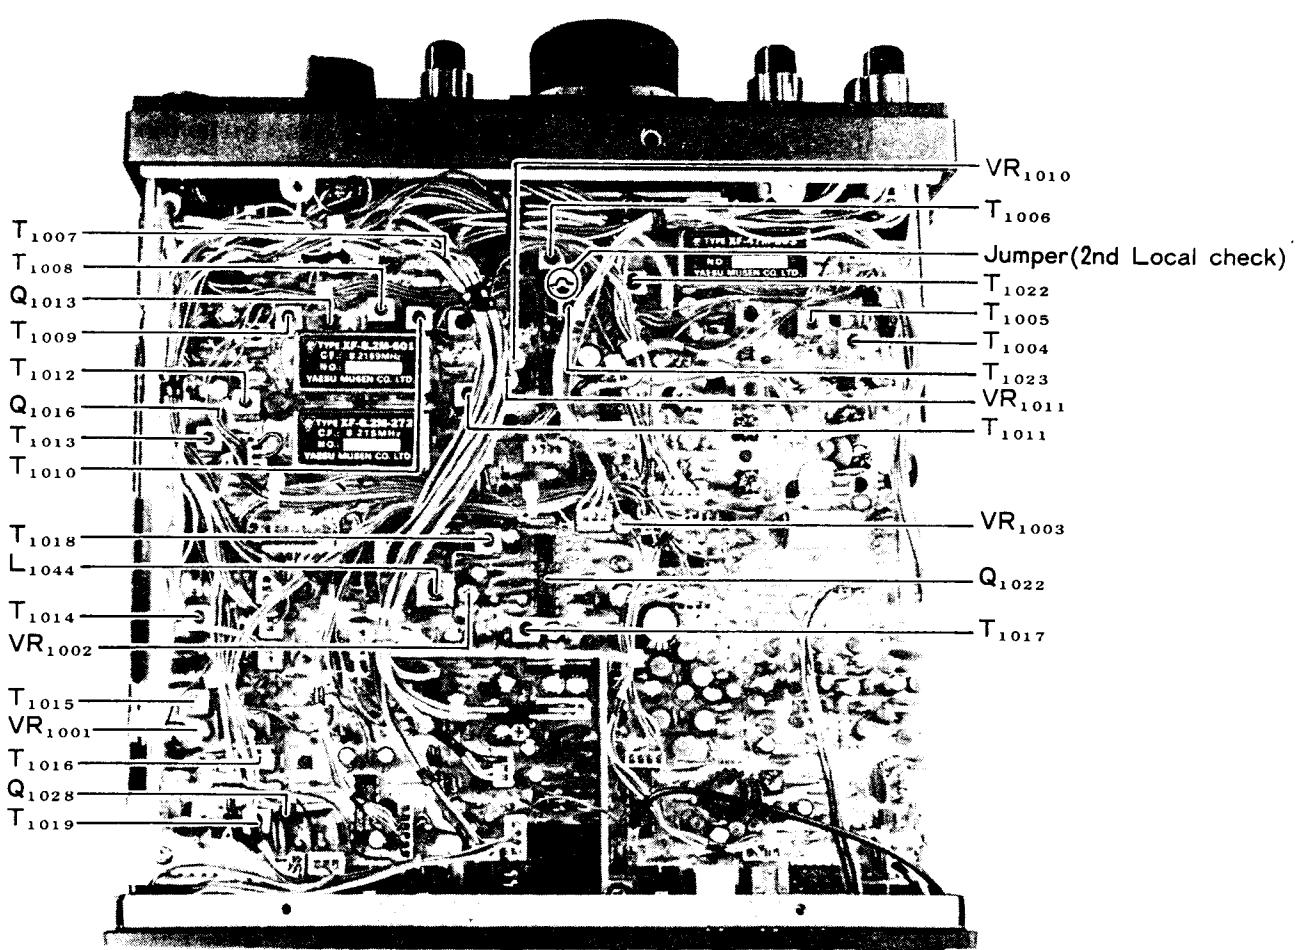

With the RF signal generator connected to the antenna jack, apply a 40 to 60 dB signal at 14.000 MHz, modulated with a 1 kHz tone at ±3.5 kHz deviation. Connect the AF voltmeter across the speaker terminals; set the SQL control fully counterclockwise, and adjust T₁₀₁₇ for maximum AF voltage on the meter.

I. Squelch Threshold

Beginning with the transceiver in the AM mode, with no signal applied at the antenna jack, advance the SQL control gradually from the fully counterclockwise position just to the point where the squelch closes. Then switch to the FM mode, and adjust VR₁₀₀₃ to the point where the squelch again just closes.

J. FM RX AF Output Level

1. With the AF voltmeter connected across the speaker terminals, apply a 40 dB signal at 14.000 MHz (with no modulation) from the RF generator to the antenna jack. Set the transceiver to the USB mode, tune for a heterodyne, and adjust the AF gain control for 0.1 V on the AF voltmeter.
2. Switch to the FM mode and modulate the RF signal with 1 kHz at ±3.5 kHz deviation, without changing the generator output level. Adjust VR₁₀₀₂ for 0.1 V on the AF voltmeter.

**Chassis Bottom View: RF Unit
RX Adjustment Locations**

RF Unit: Transmitter Circuits

A. ALC Meter Zero Set

With the transceiver tuned to 14 MHz, USB mode, and with no microphone input, key the transmitter and adjust VR₁₀₀₈ to the threshold point where ALC just starts to produce meter deflection (METER switch in ALC position).

B. TX IF Transformers

At 14 MHz, CW mode, with the METER switch set to ALC, preset VR₁₀₀₆ to the center of its range. Press the MOX switch and adjust T₁₀₂₀, T₁₀₂₁ and T₁₀₂₃ through T₁₀₂₅ for maximum deflection on the ALC meter. If no deflection is found at first, set the METER switch to PO and the rear panel FWD/REV switch to FWD. Return the METER switch to ALC when the PO indication is maximum. If the ALC indication is overscale, reduce the setting of the DRIVE control.

C. TX Power

At 14 MHz, CW mode, set the DRIVE control fully clockwise and adjust VR₁₀₀₆ for 100 watts output (10 watts for FT-757SX).

D. PO Meter

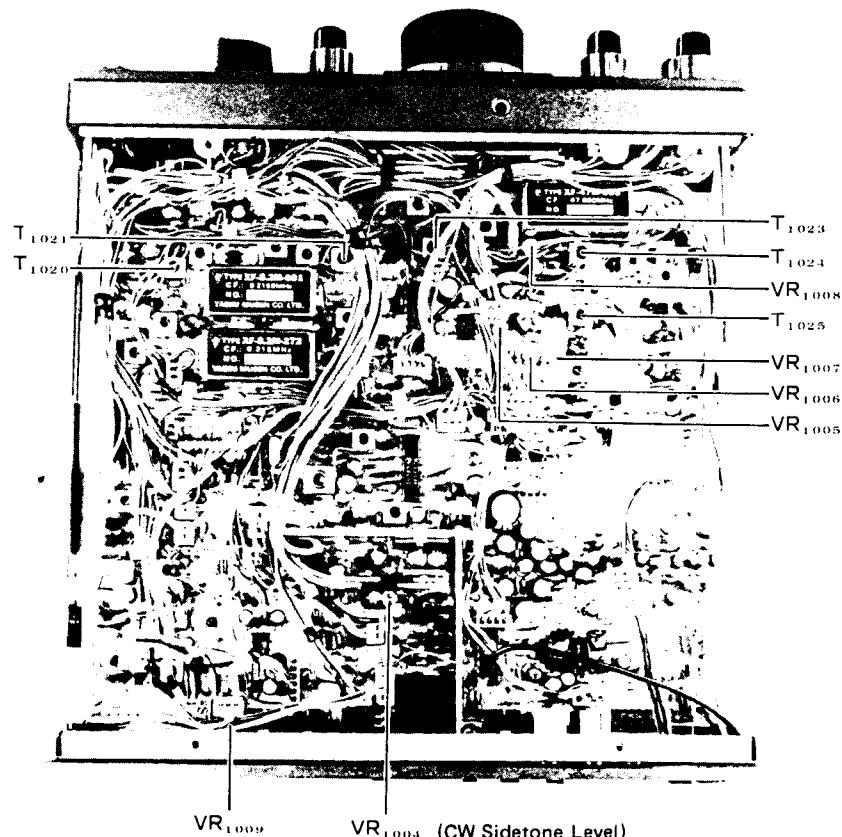

At 14 MHz, CW mode, press the MOX button and adjust the DRIVE control for 100 watts output on the external wattmeter. Set the rear panel FWD/REV switch to FWD, and with the front panel METER switch set to PO, adjust the FWD SET control for internal PO meter indication of 100 watts.

E. SWR Turndown (Automatic Final Protection)

At 14 MHz, CW mode, connect a 16.6-ohm dummy load (three 50-ohm loads in parallel) and a thru-type wattmeter to the antenna jack. Rotate the DRIVE control fully clockwise, press the MOX button, and adjust VR₁₀₀₇ to the point where power indication on the wattmeter just begins to drop.

F. CW Sidetone Level

With the AF voltmeter connected across the speaker terminals, in a CW mode with a key connected, close the key and adjust VR₁₀₀₄ for 0.3 V sidetone output on the meter.

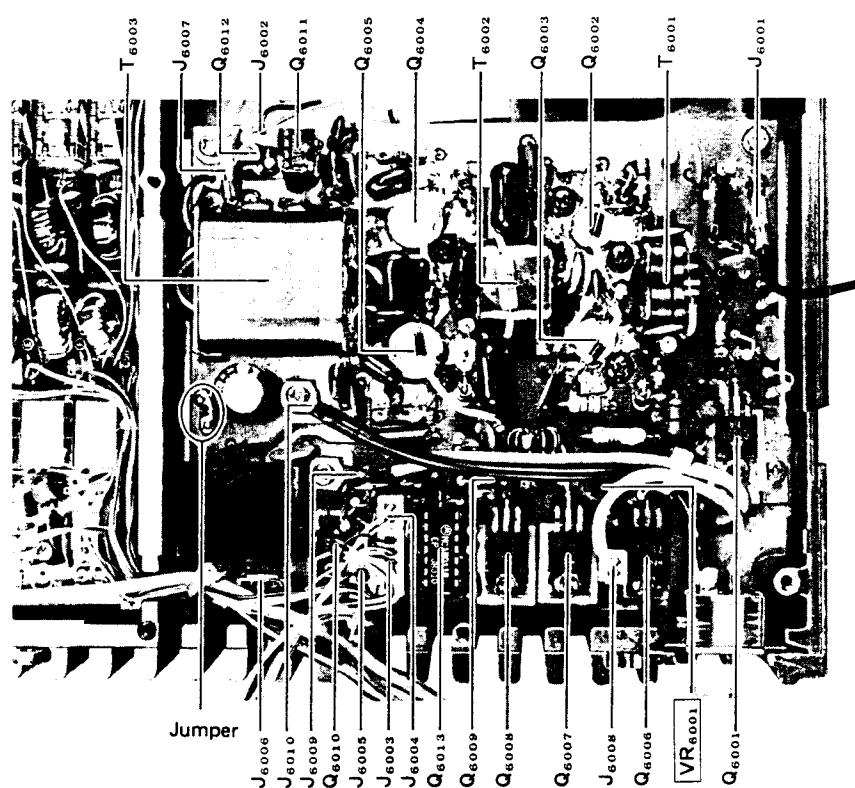

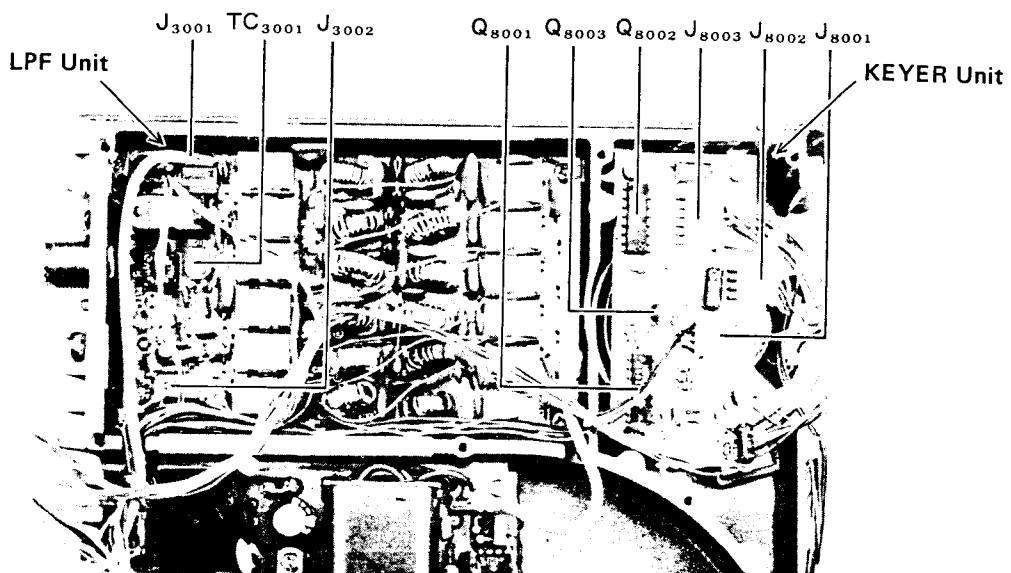

Chassis Bottom View: RF Unit
TX Adjustment Locations

LPF Unit: Directional CM Coupler Balance

Set the METER switch to PO and the rear panel FWD-REV switch to REV. Set the transceiver to the CW mode, and transmit a 14 MHz carrier into the dummy load. Adjust TC_{3001} for minimum deflection on the meter.

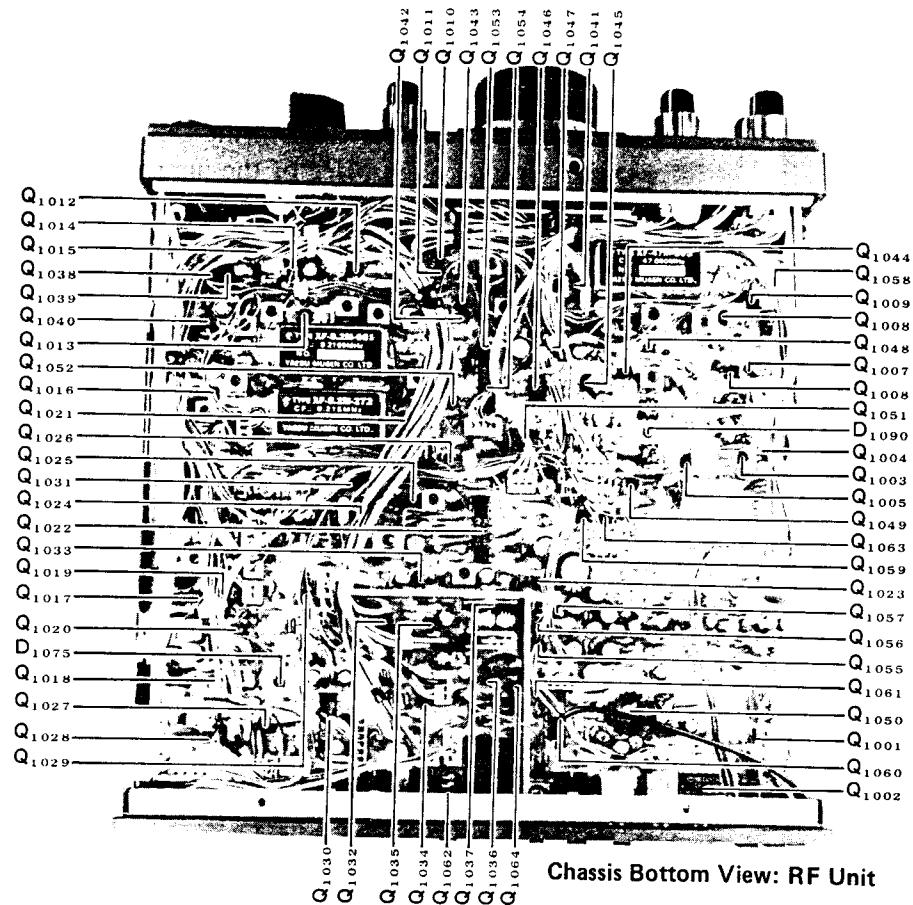

PA Unit: Idling Current

Remove the jumper shown in the following figure, and connect the DC milliammeter (500 mA range) in place of the jumper. With the transceiver set to an SSB mode and with no audio applied to the transmitter, close the PTT line and adjust VR_{6001} for 250 mA (± 100 mA) on the ammeter. Replace the jumper after the adjustment. For the FT-757SX, adjust VR_{7001} for 150 mA (± 50 mA).
